

# Have You Been Hacked

## Emergency Recovery Actions

If your systems have been hacked, it is essential to implement some emergency recovery actions to minimize the loss.

### Understand The Motivation

Once you know the motive (financial information, identity theft, etc.); you may choose the right course of action required to recover and prevent further loss.

### De-Authorize

If your affected account was used as login for another account, then unlink the accounts and de-authorize the accounts after changing passwords to log out of all devices.

### Password Reset

Change the password of the affected service and all other services that use a similar password to prevent hackers from expanding their access.

### Update Your System

Your computer may have served as the point of entry, so update the latest version of OS, buy good antivirus and run a complete system scan.

### Reclaim Your Online Accounts

Check if your social accounts have been hacked and regain access to your accounts by following platform-specific actions.

### Check For Backdoors

After reclaiming your accounts; scrutinize your privacy policies, check your emails for unauthorized activity and change answers to security questions.
