

What is Conformance Testing Of An Application?

Conformance testing, often known as non-functional testing, is a process used to assess whether or not the application developed fits the organization's required criteria.

1

Objectives

- To assure that the development and maintenance procedures follow the stated procedure.
- To ensure that the outputs from each stage of development are in accordance with the standards, methods, and guidelines.
- To examine the project documentation for completeness and relevance.

2

Requirements

- Test method standard
- Procedures for testing
- Test method standard
- Qualified personal for conducting the test
- Standard or specification for conformance tests
